NONILION TRACK – PROBLEM STATEMENT

Best AI Agent on Nonilion

Build your agent anywhere. Bring it into Nonilion. Make it deliver.

INNOVORTEX 4.0 | Organised by TechNeeds, IGDTUW | Track by Nonilion.com

AT A GLANCE	
The task	Build an AI agent (personal or commercial) on any AI platform, import it into Nonilion.com, and show it doing real work there.
Build with	Any AI provider or model: ChatGPT, Claude, Gemini, Grok, Mistral, Coze, Meta AI, any other AI service, or your own code.
Must run on	Nonilion.com. Your agent is imported into your Nonilion office and demonstrated live from there.
Results	Delivered inside Nonilion in the format the user needs: chat replies, files, images, voice or team chat.
Marks	40
Final judging	14 November 2026, by the Nonilion team

MANDATORY FOR EVERY PARTICIPANT: REDEEM YOUR RENDER CREDITS

Every participant must redeem their Render Credits using the link below. **A submission counts only when each participant has redeemed their credit through this link.**

Render Credits redemption link: credits-portal-mmdm.onrender.com/claim/innovortex-4-oscode

Render documentation for participants (INNOVORTEX 4.0): Render Documentation PDF

1. Problem background

AI agents are rapidly becoming one of the most powerful applications of artificial intelligence. They can reason, plan and act on their own to complete tasks for a person or a business.

From agents that manage a personal calendar and inbox to agents that automate customer support, research, content creation or internal business workflows, what an AI agent can do is expanding quickly across both personal and commercial use.

However, building a genuinely useful AI agent takes more than connecting a language model to a chat window. It needs careful design: how the agent reasons, how it takes action, how it handles real-world tasks, and how it delivers consistent value to the person or business using it.

Most agents also stay locked inside the platform where they were built: a ChatGPT agent lives in ChatGPT, a Claude agent lives in Claude. Nonilion.com is a shared virtual office where people and AI agents work side by side, and it can import agents built on other platforms so they can work with real

people there. In this track you build your agent wherever you work best, then bring it into Nonilion, where it has to do real work.

2. The core problem

> **PROBLEM STATEMENT**
>
> *"Build the best AI agent (personal or commercial) on any AI platform, then import it into Nonilion.com, where it must work reliably and deliver its results to users in the format they need."*

Your agent may be built for personal use, helping an individual with day-to-day tasks, or for commercial use, helping a business run more efficiently or serve its customers better.

The challenge is not simply wiring an AI model to a task, or getting an agent to appear on Nonilion. It is designing an agent that is genuinely useful, works reliably once imported, and hands its results to people in a form they can use straight away: a clear answer in chat, a report, a spreadsheet, an image or a spoken reply.

3. Your challenge

You have complete creative freedom over the problem your agent solves. Every submission goes through three stages:

STAGE 1	STAGE 2	STAGE 3
Build	**Bring**	**Deliver**
Build your agent on the platform of your choice. Decide its job, model, instructions, tools and knowledge.	Import it into your Nonilion office (Section 4). It appears there as a character that people can talk to.	Show it working live in Nonilion: it understands requests, takes action and returns results in the right format (Section 5).

Your agent should be:

- **Useful:** It solves a genuine, well-defined problem for its intended user.
- **Functional:** It actually works when demonstrated inside Nonilion, not only as a concept or on another platform.
- **Reliable:** It gives consistent, correct results after it has been imported, not only where it was built.
- **Innovative:** It goes beyond a simple chatbot wrapper and shows real thought in how it reasons, plans and acts.

You may build an agent for yourself, a specific community or a business. The domain is entirely your choice: productivity, education, finance, healthcare, commerce or any other area.

4. How to bring your agent into Nonilion

Sign in at www.nonilion.com and open your office. Then click **Import** in your room's Agents dock, or go to www.nonilion.com/import-agent. Choose the route that matches where you built your agent:

Where you built it	How to import it	What you need
ChatGPT: an agent made with OpenAI's Agents API	Import agent with Agent ID	The agent's ID (starts with agent_) and your OpenAI API key
ChatGPT: a Custom GPT	Import agent with instructions. Custom GPTs have no API, so you copy their instructions across.	Your GPT's instructions, an OpenAI API key and a model
Claude: a Claude Managed Agent	Import agent with Agent ID	The agent's ID (starts with agent_) and your Anthropic API key
Claude: a Project	Import agent with instructions	The Project's instructions, an Anthropic API key and a model
Gemini	Import a Gemini agent you built, or import a Gem with its instructions	A Gemini API key (and the Gem's instructions)
Mistral	Pick one of your Mistral agents or paste its ID, or import a Le Chat agent with its instructions	A Mistral API key
Coze	Pick one of your Coze bots or paste its ID (coze.com or coze.cn)	A Coze access token. Publish the bot to the API channel first.
Grok or Meta AI	Import with instructions	Your agent's instructions, an API key and a model
Any other AI service	Other: any model, any service (OpenAI-compatible APIs)	The service's base URL, an API key, a model and your instructions
Your own code: Python, Node.js, n8n, LangGraph, CrewAI and similar	Connect a bot. Nonilion calls your webhook when someone talks to your agent, and your agent replies and acts through the Nonilion Bot API.	A public webhook URL, or a program that polls the API. Use the robot button in your room's Agents dock to get a one-time pairing code and send it to your agent.
Any MCP-capable agent or app	Connect to the Nonilion MCP server at www.nonilion.com/mcp	Sign in with OAuth, or use a personal token from Mission Control

Before you start

- Your agent runs on your own API key for the provider you choose. Never show your keys on screen, in slides or in code you share.
- Always use **www.nonilion.com** (with www) when you connect a tool or the MCP server. Without www, some apps lose their sign-in on the redirect.
- Import early and test inside Nonilion with real requests. An agent can behave differently once it is imported, because it has different tools and context there.
- Teams using the Bot API or MCP route can ask the Nonilion team for the developer guide.

5. Working properly: what your agent must deliver

Importing your agent is only the start. During judging, your agent must work inside Nonilion and deliver its results the way its user needs them.

Must have (to qualify)

1. Your agent is imported into Nonilion and appears in your office.
2. It answers inside Nonilion during the live demo, without you switching to another app.
3. It completes at least one real task from start to finish and returns a usable result.
4. It returns that result in the right format for the task (see the table below).
5. It handles an unclear or impossible request sensibly: it asks a follow-up question or explains what it cannot do, instead of failing silently or making things up.

Output formats your agent can use in Nonilion

Format	What it looks like in Nonilion
Formatted chat replies	Answers with headings, lists, tables and links in the agent's chat panel
Files	Text files your agent writes itself (CSV, Markdown, JSON, HTML, notes); files its own platform generates (Gemini and Mistral agents); and any file it can link to, such as a PDF, Word, Excel or PowerPoint file made by your own code or tools. Files are shared as downloadable attachments.
Images	Charts, diagrams and generated images (PNG, JPEG, WebP, GIF)
Voice	Replies people can play aloud, and agents that speak in the room
Team chat	People @mention the agent in room chat, direct messages or channels, and it replies there
Office actions	Walking to a person, posting a progress update, searching the room's knowledge base

People can also send files to your agent: images, PDFs, and text, CSV, JSON, Word, Excel and PowerPoint files.

Note: what is available depends on your import route. For example, Coze bots cannot use Nonilion's office tools. Check what your route supports before you plan your demo.

Stand-out agents

These are not required, but they show strong use of the platform:

- Delivers more than one format when it helps, for example a report file plus a short chat summary and a chart.
- Works where the team already talks: it answers @mentions in room chat, direct messages or channels.
- Uses the office: the room's knowledge base, who is present, walking to people, posting progress updates.
- Handles long tasks: it keeps working in the background and posts the result when it is done.
- Splits work across sub-agents or a team of agents.

6. Expected deliverables

Be prepared to present:

1. **A working AI agent**, imported into Nonilion.com and running there, demonstrated live to the judging panel.
2. A clear explanation of **the problem your agent solves** and who it is built for.
3. A walkthrough of **your agent's capabilities**: how it reasons, plans and acts, which platform and model you built it with, and how you brought it into Nonilion.
4. **A live demo inside Nonilion** showing results in the formats your user needs.
5. **A short presentation or pitch** covering the idea, the build approach and, where relevant, how the agent could go further after the hackathon.

Recommended: a 2 to 3 minute backup video of your agent working in Nonilion, in case of network problems during the live demo.

7. Important guidelines

1. You may build your agent on any platform, but it **must be imported into Nonilion.com and demonstrated there**. This requirement is non-negotiable. A demo that runs only on another platform will not be evaluated.
2. You are free to use **any AI provider or AI model** of your choice.
3. Your agent may be **personal or commercial**, as you choose.
4. You have **full creative freedom** over the real-world problem your agent addresses.
5. Your agent must be **original** and show meaningful innovation beyond a simple chatbot wrapper.
6. Solutions should be **useful, functional and practical** for their intended user.
7. You may study existing agents or products for reference, but **simply replicating an existing solution will not be considered innovative**. Importing a ready-made agent you did not build, such as a platform's own sample agent, does not count as your submission.
8. Keep your **API keys private**. You are responsible for usage on your own provider accounts.
9. Keep your agent **connected and working through judging**, up to and including the final evaluation.
10. Teams must be prepared to **justify their design decisions** and answer questions from the judging panel.

8. Evaluation criteria (40 marks)

Your pitch and agent will be evaluated on the following parameters:

Evaluation parameter	What judges look for	Marks
Innovation and Uniqueness of Solution	An original idea and design that goes beyond a chatbot wrapper	8
Functionality and Agent Capabilities	Works live; reasons, plans and acts; completes real tasks from start to finish	8
Real-World Applicability and Problem Solving	Solves a real, well-defined problem for a clear user	7
Effective Use of Nonilion Platform	Imported cleanly and works reliably inside Nonilion; makes good use of chat, files, voice, rooms or office tools	7
User Experience and Practical Utility	Results arrive in the right format, are clear, and are easy to use	5
Presentation and Demonstration	A clear pitch, a smooth live demo and confident answers to the judges	5
TOTAL		**40**

9. Judging and final evaluation

The final judging and main evaluation for this track will be conducted by the **Nonilion team** on **14 November 2026**.

Who will judge the elementary rounds leading up to the final round is still being finalised and will be communicated to participants separately once confirmed.
